

# Increase security by monitoring and managing your antivirus software.

## What is antivirus management?

Request status updates, view lists of threats, initiate scans and more in a single dashboard. With LogMeIn Central, you can manage the antivirus software you already have deployed or take advantage of our built-in LogMeIn Antivirus software powered by Bitdefender to keep all your computers secure.

## Antivirus at a glance

**Monitor:** Watch the antivirus status on the Computers list to see whether a host requires immediate attention, a virus definition is out of date and more.

**Manage:** View detailed antivirus information such as virus definition version, real-time protection, last full scan time, threat log and more.

## Antivirus indicators

**Red** The host requires immediate attention because either Real-time Protection is turned off or there is no antivirus software installed.

**Orange** The host requires attention because there is an issue with the antivirus software. For example, its virus definition is out of date or there are unacknowledged threats.

**Green** The antivirus software is up and running and the host is not infected.

**Silver** There is not enough information about the antivirus software running on the host, but the available details do not suggest any problem with the host. Make sure that you have the latest LogMeIn host version, your computer is online and the anti-virus software is enabled and supported by LogMeIn.

## Getting started:

Access antivirus functionality from the **Antivirus** left-hand column in the Central dashboard. Select one or multiple computers and then from the **Actions** menu, click **Install or update antivirus** to install or update on selected computers. Antivirus is then installed or updated in the background without user interruption.

## Supported antivirus software
